

## **Fork Positioner for Forklifts**

Fork Positioner for Forklift - A fork positioner is an apparatus constructed out of top quality materials intended to be able to withstand the most difficult operations and work environments. This piece of equipment could enable the one driving to be able to operate the blades hydraulically without leaving the seat. Side shifting units have the added ability to laterally position the arms or the entire load so as to facilitate much more exact carrying and placement in a faster and much more effective manner.

The only one of its kind fork pocket design can enable operators to be able to securely sway the unit's blades without any fear of damaging the positioning cylinders. This allows the operator the option to either execute simultaneous or independent blade movement, depending on the requirements of the job. For most forklifts with non-OEM carriages, complete carriages are considered necessary. Standard OEM carriages could be transformed into blade positioners on existing units.
